Contenido

Capítulo 1 Prefacio**Nº de ident. 3 176 995**

Observaciones	1	-	1
Hoja de características fundamentales	1	-	2
Observaciones generales	1	-	3
Observaciones sobre la velocidad del viento	1	-	7
Observaciones para el trabajo con la punta rabatible	1	-	11
Observaciones para el trabajo con prolongación de la pluma	1	-	15
Combinaciones de contrapeso	1	-	17
Áreas de trabajo			
Áreas de trabajo de la pluma principal	1	-	25
Áreas de trabajo de la plumín rabatible	1	-	29
Áreas de trabajo de la prolongación de la pluma	1	-	37
Tabla de equipamiento			
Tablas de equipamiento de la pluma principal	1	-	51
3 174 200 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	40.1 t 1 - 52
3 174 210 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	40.1 t 1 - 55
3 174 201 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	28.5 t 1 - 58
3 174 211 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	28.5 t 1 - 61
3 174 202 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	26 t 1 - 64
3 174 212 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	26 t 1 - 67
3 174 203 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	23.5 t 1 - 70
3 174 213 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	23.5 t 1 - 73
3 174 204 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	21 t 1 - 76
3 174 214 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	21 t 1 - 79
3 174 205 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	18.5 t 1 - 82
3 174 215 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	18.5 t 1 - 85
3 174 206 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	16 t 1 - 88
3 174 216 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	16 t 1 - 91
3 174 207 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	13.5 t 1 - 94
3 174 217 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	13.5 t 1 - 97
3 174 208 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	11 t 1 - 100
3 174 218 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	11 t 1 - 103
3 174 209 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	8.5 t 1 - 106
3 174 219 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	8.5 t 1 - 109
3 174 220 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	6 t 1 - 112
3 174 223 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	6 t 1 - 115
3 174 221 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	3.5 t 1 - 118
3 174 224 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	3.5 t 1 - 121
3 174 222 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	1 t 1 - 124
3 174 225 Longitudes fijas / intermedias	7,80 x 7,50 m	360°	1 t 1 - 127
3 174 230 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	40.1 t 1 - 130
3 174 240 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	40.1 t 1 - 133
3 174 231 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	28.5 t 1 - 136
3 174 241 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	28.5 t 1 - 139
3 174 232 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	26 t 1 - 142
3 174 242 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	26 t 1 - 145
3 174 233 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	23.5 t 1 - 148
3 174 243 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	23.5 t 1 - 151
3 174 234 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	21 t 1 - 154
3 174 244 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	21 t 1 - 157
3 174 235 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	18.5 t 1 - 160
3 174 245 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	18.5 t 1 - 163
3 174 236 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	16 t 1 - 166
3 174 246 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	16 t 1 - 169
3 174 237 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	13.5 t 1 - 172
3 174 247 Longitudes fijas / intermedias	7,80 x 6,70 m	360°	13.5 t 1 - 175

3 174 238	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	11 t 1	-	178
3 174 248	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	11 t 1	-	181
3 174 239	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	8.5 t 1	-	184
3 174 249	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	8.5 t 1	-	187
3 174 250	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	6 t 1	-	190
3 174 253	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	6 t 1	-	193
3 174 251	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	3.5 t 1	-	196
3 174 254	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	3.5 t 1	-	198
3 174 252	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	1 t 1	-	200
3 174 255	Longitudes fijas / intermedias	7,80 x 6,70 m	360°	1 t 1	-	202
3 174 260	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	40.1 t 1	-	204
3 174 270	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	40.1 t 1	-	207
3 174 261	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	28.5 t 1	-	210
3 174 271	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	28.5 t 1	-	213
3 174 262	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	26 t 1	-	216
3 174 272	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	26 t 1	-	219
3 174 263	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	23.5 t 1	-	222
3 174 273	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	23.5 t 1	-	225
3 174 264	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	21 t 1	-	228
3 174 274	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	21 t 1	-	231
3 174 265	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	18.5 t 1	-	234
3 174 275	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	18.5 t 1	-	237
3 174 266	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	16 t 1	-	240
3 174 276	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	16 t 1	-	243
3 174 267	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	13.5 t 1	-	246
3 174 277	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	13.5 t 1	-	249
3 174 268	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	11 t 1	-	252
3 174 278	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	11 t 1	-	255
3 174 269	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	8.5 t 1	-	258
3 174 279	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	8.5 t 1	-	260
3 174 280	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	6 t 1	-	262
3 174 283	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	6 t 1	-	264
3 174 281	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	3.5 t 1	-	266
3 174 284	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	3.5 t 1	-	267
3 174 282	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	1 t 1	-	268
3 174 285	Longitudes fijas / intermedias	7,80 x 5,90 m	360°	1 t 1	-	269
3 174 291	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	28.5 t 1	-	270
3 174 301	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	28.5 t 1	-	273
3 174 292	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	26 t 1	-	276
3 174 302	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	26 t 1	-	279
3 174 293	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	23.5 t 1	-	282
3 174 303	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	23.5 t 1	-	285
3 174 294	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	21 t 1	-	288
3 174 304	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	21 t 1	-	291
3 174 295	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	18.5 t 1	-	294
3 174 305	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	18.5 t 1	-	297
3 174 296	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	16 t 1	-	300
3 174 306	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	16 t 1	-	303
3 174 297	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	13.5 t 1	-	306
3 174 307	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	13.5 t 1	-	309
3 174 298	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	11 t 1	-	312
3 174 308	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	11 t 1	-	314
3 174 299	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	8.5 t 1	-	316
3 174 309	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	8.5 t 1	-	318
3 174 310	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	6 t 1	-	320
3 174 313	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	6 t 1	-	322
3 174 311	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	3.5 t 1	-	324
3 174 314	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	3.5 t 1	-	325
3 174 312	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	1 t 1	-	326
3 174 315	Longitudes fijas / intermedias	7,80 x 5,10 m	360°	1 t 1	-	327
3 174 360	Longitudes fijas / intermedias	7,80 x 2,50 m	0° h.a.	40.1 t 1	-	328

3 175 364	26 m / 20 - 40° (carga basculante)	7,80 x 5,90 m	360°	21 t 4	-	227
3 175 309	32 m / 0° angulado	7,80 x 5,90 m	360°	21 t 4	-	229
3 175 339	32 m / 0 - 20° (àngulo intermedio)	7,80 x 5,90 m	360°	21 t 4	-	230
3 175 349	32 m / 20 - 40° (àngulo intermedio)	7,80 x 5,90 m	360°	21 t 4	-	231
3 175 359	32 m / 0 - 20° (carga basculante)	7,80 x 5,90 m	360°	21 t 4	-	232
3 175 369	32 m / 20 - 40° (carga basculante)	7,80 x 5,90 m	360°	21 t 4	-	233

Observaciones a las tablas de capacidad de carga 85%

Hoja de características fundamentales

Fabricante:	Manitowoc Crane Group Germany GmbH		
Año de construcción:	Véase la placa del fabricante en el conjunto superior		
Modelo:	GMK 5130-2		
N.º de referencia:	Véase el sello de la portada		
Máxima capacidad de carga:	120 t con 2,2 m de alcance, +/- 0° hacia atrás		
Máxima capacidad de carga con equipo opcional:	130 t con 2,2 m de alcance, +/- 0° hacia atrás		
Denominación de la grúa:	Grúa camión según DIN 15 001, apartado 1		
Uso de la grúa:	Grúa de montaje según DIN 15 001, apartado 2		
Tipo de grúa:	Clase de elevación H1 según DIN 15 018, apartado 1 clase de grúa A1 según ISO 4301, apartado 2		
Grupo de accionamiento:	Mecanismo de elevación:	M3 según ISO 4301, apartado 2	
	Mecanismo de giro:	M2 según ISO 4301, apartado 2	
	Mecanismo para cambio de alcance:	M2 según ISO 4301, apartado 2	
	Mecanismo de extensión de la pluma:	M1 según ISO 4301, apartado 2	

Observaciones generales

Las capacidades de carga no superan el 85% de la carga de vuelco.
Los valores de resistencia se han calculado según la norma DIN 15018.3.

En esta documentación pueden figurar equipamientos, por ejemplo combinaciones de contrapeso o plumas, que no forman parte del volumen de suministro.

Lo que determina cuál es el volumen de suministro es la programación del LMB.

Para planificar y realizar trabajos con la grúa, únicamente son válidas las tablas de cargas portantes que figuran más abajo. Los valores de la hoja de características no son vinculantes.

Indicaciones especiales sobre las tablas de cargas portantes.

- El gruista debe comprobar que en ningún caso se sobrepasan los valores de carga y alcance indicados por la tabla de cargas portantes. Ni siquiera el limitador del momento de carga disponible le exime de esta obligación.
- El limitador del momento de carga no se debe utilizar como báscula.
- El estado de servicio previsto se debe ajustar en el LMB (código del LMB y colocación del cable).

Atención:**Peligro de vuelco durante el servicio con dos ganchos**

El limitador del momento de carga (LMB) tan sólo garantiza la seguridad durante el servicio con un solo gancho.

El limitador del momento de carga no garantiza la seguridad durante el servicio con dos ganchos.

- Capacidad de carga = carga útil + motón de gancho + medio de sujeción

La capacidad de carga tan sólo es válida si la grúa está nivelada horizontalmente.

- Antes de comenzar a trabajar, nivele la grúa horizontalmente. Durante el servicio, vigílela permanentemente. Sólo está permitido corregir la estabilización de la grúa cuando ésta se halla libre de carga.

La capacidad de carga sólo es válida si la grúa no tiene la punta abatible o Mega Wing Lift abatida sobre la pluma.

Margen de temperatura: entre +40°C y -25°C teniendo en cuenta las indicaciones del manual de instrucciones.

La capacidad de carga sólo es válida para grúas en las que no está abatida sobre la pluma la punta abatible.

- Ajuste la velocidad de giro permitida para el estado de servicio previsto con el correspondiente rendimiento de la carga.
- Tracción de cable de 70 kN para el mecanismo principal de elevación y el mecanismo auxiliar de elevación.
- Si se trabaja con tablas de longitud fija de la pluma principal, las secciones telescópicas deben estar fijadas con pernos.

La pluma principal no debe bascularse (bajarse) más allá del área de trabajo admisible. Dependiendo del estado de equipamiento (contrapeso, radio de giro, estado de extensión/retracción y base de apoyo) la pluma puede no obstante bajarse con ayuda de las curvas de equipamiento a 0°.

Atención:

Peligro de vuelco al trabajar sobre los neumáticos.

En posición autoestable (sobre los neumáticos) la pluma principal no debe elevarse con un alcance superior a 3,0 m. El limitador del momento de carga (LMC) supervisa el alcance y desactiva la elevación.

Atención:

Peligro de vuelco al trabajar sobre los neumáticos.

No girar el conjunto superior en posición autoestable (sobre los neumáticos).

Peligro de vuelco hacia atrás.

Atención:

Peligro de vuelco con una base de apoyo de 7,80 x 2,50 m.

Con la base de apoyo de 7,80 x 2,50 m (soportes de apoyo completamente retraídos) la pluma principal no debe elevarse con un alcance superior a 3,0 m. El limitador del momento de carga (LMC) supervisa el alcance y desactiva la elevación. En este estado de servicio no está autorizado el puenteo del LMC.

Peligro de vuelco hacia atrás.

Atención:

Peligro de vuelco con una base de apoyo de 7,80 x 2,50 m.

Con la base de apoyo de 7,80 x 2,50 m (soportes de apoyo completamente retraídos) no debe girarse el conjunto superior con un contrapeso de más de 3,5 t.

Peligro de vuelco hacia atrás.

Atención:

Peligro de vuelco.

El mecanismo auxiliar de elevación forma parte del contrapeso. Si el mecanismo auxiliar de elevación no está equipado, en el conjunto superior debe estar montado el correspondiente peso compensatorio (1,0 t).

- Pesos de los motores de gancho Peso

Motón de gancho (9 poleas)	110,0 t	1700 kg
Motón de gancho (7 poleas)	100,0 t	1150 kg
Motón de gancho (5 poleas)	75,0 t	850 kg
Motón de gancho (3 poleas)	50,0 t	675 kg
Motón de gancho (1 polea)	20,0 t	325 kg
Aparejo de gancho(1 ramal)	8,0 t	200 kg

Atención:

Peligro de que se afloje el cable.

Según la longitud de la pluma y de la colocación del cable de elevación se requiere un peso mínimo de motón de gancho con medio de sujeción. Si no se alcanza este peso mínimo y el motón de gancho se encuentra sin carga en la posición más elevada, puede aflojarse el cable en el tambor del mecanismo de elevación.

En la siguiente tabla figuran valores orientativos para el peso mínimo del motón de gancho:

**Peso mínimo de motones de gancho en t
(motón de gancho)**

Máxima	Colocación del cable de elevación				
	1 ramal	2 / 3 ramales	4 a 6 ramales	7 a 11 ramales	12 a 16 ramales
longitud de la pluma					
12,90 m	0,1 t (1 ramal)	0,3 t (1 polea)	0,6 t (3 poleas)	1,1 t (7 poleas)	1,7 t
22,48 m	0,2 t (1 ramal)	0,3 t (1 polea)	0,7 t (5 poleas)	1,3 t	2,0 t
31,84 m	0,2 t (1 ramal)	0,4 t (3 poleas)	0,8 t (5 poleas)	1,5 t	--
41,24 m	0,2 t (1 ramal)	0,5 t (3 poleas)	0,9 t (7 poleas)	--	--
50,71 m	0,2 t (1 ramal)	0,5 t (3 poleas)	1,0 t (7 poleas)	--	--
60,00 m	0,2 t (1 ramal)	0,6 t (3 poleas)	--	--	--

En la tabla siguiente se indica la altura que puede alcanzar el gancho en las diferentes configuraciones con la mayor inclinación de la pluma (alcance mínimo).

Longitud de la pluma	Cable	Altura mínima del gancho con la mayor inclinación de la pluma (longitudes de cable = 255 m)	Carga portante máxima (*limitada por la tabla)
12,90 m	15	0 m	103,0 t
	16	2 m	120,0 t
17,69 m	11	0 m	76,2 t
	13	3 m	89,6 t (86,0 t)*
22,48 m	8	0 m	55,8 t
	10	3 m	69,4 t
	12	7 m	82,9 t (81,0 t)*
27,16 m	7	0 m	49,0 t
	8	3 m	55,8 t
	9	6 m	62,6 t
31,84 m	6	0 m	42,1 t
	7	4 m	49,0 t
	8	8 m	55,8 t (50,0 t)*
36,45 m	5	0 m	35,1 t
	6	5 m	42,1 t (38,0 t)*
41,24 m	4	0 m	28,2 t (28,0 t)*
45,99 m	3	0 m	21,2 t (20,5 t)*
50,71 m	3	0 m	21,2 t (16,0 t)*
55,39 m	2	0 m	14,2 t (11,6 t)*
60,00 m	2	0 m	14,2 t (10,0 t)*

Observaciones sobre las velocidades del viento y cálculo de las superficies de resistencia al viento

- El servicio de grúa sólo es admisible hasta las velocidades del viento máximas correspondiente indicadas en la tabla de cargas máximas.

Atención:

Peligro de accidente.

El operario de grúa debe informarse antes del trabajo acerca de las velocidades del viento que pueden esperarse. Si se esperan velocidades del viento no admisibles está prohibido elevar la carga.

Si se supera la velocidad del viento admisible durante el trabajo debe detenerse inmediatamente el servicio de grúa y poner la grúa en un estado de equipamiento de acuerdo a los siguientes apartados. Esto es también aplicable cuando la superficie de resistencia al viento es menor que la superficie de resistencia al viento admisible (A_{adm}).

Servicio con la pluma principal

Velocidades del viento > 20 m/s

- Pose la carga.
- Retraiga totalmente la pluma principal.
- Gire el conjunto superior hacia delante o hacia atrás.
- Pose la pluma principal.

Velocidades del viento <= 20 m/s

- Pose la carga.
- Gire el conjunto superior de tal forma que la pluma principal ofrezca la menor superficie de resistencia posible al viento.
- Eleve la pluma principal de acuerdo a la siguiente tabla:

Longitud de la pluma m	Velocidad del viento		
	hasta 10 m/s	10 a 14 m/s	14 a 20 m/s
> 50 a 60 m	Elevar la pluma a > 50°	Elevar la pluma a > 70°	Elevar la pluma a > 80°
> 40 a 50 m	Elevar la pluma a > 30°	Elevar la pluma a > 60°	Elevar la pluma a > 75°
> 30 a 40 m	ninguna	Elevar la pluma a > 35°	Elevar la pluma a > 65°
> 20 a 30 m		ninguna	Elevar la pluma a > 40°
<= 20 m	limitación	limitación	ninguna limitación

Servicio con punta abatible o prolongación de pluma

Velocidades del viento > 20 m/s

- Pose la carga.
- Retraiga totalmente la pluma principal.
- Gire el conjunto superior hacia delante o hacia atrás.
- Baje la pluma principal hasta que las poleas del cabezal de la punta abatible / la prolongación toquen el suelo.

Velocidades del viento <= 20 m/s

- Pose la carga.
- Gire el conjunto superior de forma que la pluma principal y la punta abatible ofrezcan la menor superficie de resistencia al viento posible.
- Eleve y entienda/retraiga la pluma principal de acuerdo a las siguientes tablas:

Punta abatible

11 m / 18 m

Longitud de la pluma m	Velocidad del viento		
	hasta 10 m/s	10 a 14 m/s	14 a 20 m/s
> 50 a 60 m	Elevar la pluma a > 65°	Elevar la pluma a > 75°	no admisible
> 40 a 50 m	Elevar la pluma a > 50°	Elevar la pluma a > 70°	Elevar la pluma a > 80°
> 30 a 40 m	Elevar la pluma a > 30°	Elevar la pluma a > 65°	Elevar la pluma a > 75°
> 20 a 30 m	ninguna limitación	Elevar la pluma a > 45°	Elevar la pluma a > 70°
<= 20 m		ninguna limitación	Elevar la pluma a > 55°

Prolongación de pluma

26 m / 32 m

Longitud de la pluma m	Velocidad del viento		
	hasta 10 m/s	10 a 14 m/s	14 a 20 m/s
> 50 a 60 m	Elevar la pluma a > 70°	Elevar la pluma a > 80°	no admisible
> 40 a 50 m	Elevar la pluma a > 65°	Elevar la pluma a > 80°	no admisible
> 30 a 40 m	Elevar la pluma a > 55°	Elevar la pluma a > 75°	no admisible
> 20 a 30 m	Elevar la pluma a > 30°	Elevar la pluma a > 70°	no admisible
<= 20 m	ninguna limitación	Elevar la pluma a > 55°	Elevar la pluma a > 80°

En la tabla siguiente se ofrece una visión general de la intensidad y de la velocidad del viento y su repercusión:

Intensidad del viento		Velocidad del viento		Repercusiones del viento en tierra adentro
Número de Beaufort	Denominación	m/s	km/h	
0	Calma	0 - 0,2	1	Calma, el humo se eleva verticalmente.
1	Corriente de aire débil	0,3 - 1,5	1 - 5	La dirección del viento sólo se puede determinar siguiendo el curso del humo, pero no con una veleta.
2	Brisa ligera	1,6 - 3,3	6 - 11	Se siente el viento en la cara, se oye un susurro de hojas, la veleta se mueve.
3	Brisa leve	3,4 - 5,4	12 - 19	Se mueven las hojas y las ramas pequeñas, el viento puede mover un banderín.
4	Brisa moderada	5,5 - 7,9	20 - 28	El viento levanta el polvo y papeles caídos, mueve banderines y ramas pequeñas.
5	Brisa fresca	8,0 - 10,7	29 - 38	Los árboles pequeños y frondosos empiezan a balancearse. Se forman crestas de espuma en los lagos.
6	Viento fuerte	10,8 - 13,8	39 - 49	Se mueven ramas grandes. Silbido de líneas telegráficas, difícil llevar paraguas.
7	Ventarrón	13,9 - 17,1	50 - 61	Se mueven árboles enteros, es difícil andar contra el viento.
8	Viento violento	17,2 - 20,7	62 - 74	Rompe ramas de árboles, es difícil andar en espacios abiertos.
9	Tormenta	20,8 - 24,4	75 - 88	Los edificios sufren ligeros daños (pueden caer tejas y la cubierta de la chimenea).
10	Tormenta fuerte	24,5 - 28,4	89 - 102	Árboles arrancados de cuajo, daños graves en los edificios.

Para determinar las velocidades de viento admisibles se ha calculado para la carga una superficie de resistencia al viento de $A_{zul} = 1,0 \text{ m}^2$ por t de carga portante durante el servicio de grúa y un coeficiente de resistencia al viento de $c_w = 1,2$. Si las superficie de resistencia al viento efectiva A_L y/o el coeficiente de resistencia al viento c_V son superiores, el servicio de grúa sólo es admisible con la velocidad del viento mínima correspondiente v_{red} .

En caso de falta de indicaciones precisas sobre el coeficiente de resistencia al viento c_w se debe calcular el valor $c_w = 2, 4$. Los valores precisos pueden consultarse en las normas correspondientes (p. ej. ISO 4302) o en las tablas.

La siguiente fórmula permite averiguar la velocidad del viento reducida v_{red} :

$$V_{red} = V_{zul} * \sqrt{\frac{1.2 * A_{zul}}{c_L * A_L}}$$

A continuación un ejemplo ilustrativo:

- Capacidad de carga según la Tabla de cargas portantes $P = 16 \text{ t}$
- Velocidad máxima admisible para el viento según la Tabla de cargas portantes $v_{zul} = 9 \text{ m/s}$
- Superficie real de resistencia al viento de la carga $A_{lst} = 20 \text{ m}^2$ (p.ej. un elemento de cemento con una altura de 2 m y una longitud de 10 m)
- Coeficiente efectivo de resistencia al viento de la carga $c_w = 1,3$ (valores c, véase p. ej. ISO 4302, pág. 4).

De esto modo se obtienen los siguientes valores:

- Superficie de resistencia al viento admisible

$$A_{zul} = 16 \text{ t} * 1.0 \text{ m}^2/\text{t} = 16 \text{ m}^2$$

- Velocidad del viento reducida

$$V_{red} = 9 \text{ m/s} * \sqrt{\frac{1.2 * 16 \text{ m}^2}{1.3 * 20 \text{ m}^2}} = 7,7 \text{ m/s}$$

Observaciones sobre el trabajo con punta abatible

- Si la punta abatible está abatida sobre el cuerpo básico, se reduce la capacidad de carga de la pluma principal. El sistema de control de la grúa y el LMC reconocen automáticamente si en la pluma principal se ha montado además la punta abatible. El indicador LMC de capacidad máxima de carga se reduce automáticamente teniendo en cuenta la longitud de la pluma disponible. En los indicadores que muestran la carga y alcance reales, se visualizan siempre los valores correctos.

La siguiente fórmula permite averiguar la reducción:

$$x = \frac{14,0}{\text{longitud de la pluma [en m]}} \quad [\text{en t}]$$

En la siguiente tabla figuran ejemplos de reducción:

Longitud de la pluma	Reducción de la capacidad máx. de carga
12,9 m	1,10 t
22,5 m	0,60 t
31,8 m	0,45 t
41,2 m	0,30 t
60,0 m	0,25 t

Al trabajar con la punta abatible y con el motón de gancho colocado en la pluma principal, las capacidades de carga se reducen como se muestra a continuación:

Peso del aparejo de gancho / del motón de gancho	Puntaabatible	
	11,0 m	18,0 m
8,0 t - 200 kg	200 kg	200 kg
20,0 t - 325 kg	300 kg	300 kg
50,0 t - 675 kg	600 kg	600 kg
75,0 t - 850 kg	800 kg	700 kg
100,0 t - 1150 kg	1000 kg	900 kg

Indicación:

El peso del motón de gancho, así como el de una carga en la pluma principal no está asegurado por el LMC. El LMC sólo registra la carga de la pluma de punta y el peso de la punta abatible.

Atención:**Peligro de sobrecarga y vuelco.**

Si la punta abatible de 11,0 / 18,0 m se ha montado en el cabezal de la pluma principal, está permitido elevar cargas también con la pluma principal. Esta operación sólo es admisible en aquellos estados de equipamiento (contrapeso, base de apoyo, radio de giro) en los que también está permitido trabajar con la punta abatible.

- Las siguientes tablas muestran los valores a los que se reducen la capacidad de carga de la pluma principal y la velocidad máxima del viento al trabajar con una punta abatible de 11,0 / 18,0 m fijada con pernos. El LMC no muestra estos valores correctamente en el indicador del LMC, por lo que en ningún caso debe utilizarse el LMC como báscula en este estado de equipamiento.

Con una punta abatible de 11,0 m:

Longitud de la pluma	Máx. velocidad del viento admisible	Punta abatible de 11,0 m sin con motón de gancho de 20,0 t (325 kg)	
12,90 m a 22,48 m	12 m/s	3 000 kg	4 500 kg
> 22,48 m a 31,84 m	10 m/s	2 700 kg	4 000 kg
> 31,84 m a 41,24 m	9 m/s	2 500 kg	3 700 kg
> 41,24 m a 50,71 m	8 m/s	2 200 kg	3 200 kg
> 50,71 m a 60,00 m	7 m/s	2 000 kg	2 900 kg

Con una punta abatible de 18,0 m:

Longitud de la pluma	Máx. velocidad del viento admisible	Punta abatible de 18,0 m sin con motón de gancho de 20,0 t (325 kg)	
12,90 m a 22,48 m	10 m/s	3 800 kg	5 800 kg
> 22,48 m a 31,84 m	9 m/s	3 500 kg	5 300 kg
> 31,84 m a 41,24 m	8 m/s	3 300 kg	5 000 kg
> 41,24 m a 50,71 m	7 m/s	3 100 kg	4 700 kg
> 50,71 m a 60,00 m	7 m/s	2 900 kg	4 500 kg

- Si se trabaja con punta abatible, las secciones telescopicas deben estar fijadas con pernos.
- Si es preciso bajar la pluma principal hasta la horizontal con la punta abatible montada, deben retraerse previamente todas las secciones telescopicas.

Atención:**Peligro de que se afloje el cable.**

Según la longitud del sistema (longitud de la pluma principal + longitud de la pluma de punta) y de la colocación del cable de elevación se requiere un peso mínimo de motón de gancho con medio de sujeción. Si no se alcanza este peso mínimo y el motón de gancho se encuentra sin carga en la posición más elevada, puede aflojarse el cable en el tambor del mecanismo de elevación.

En la siguiente tabla figuran valores orientativos para el peso mínimo del motón de gancho:

Peso mínimo de motones de gancho en t (motón de gancho)		
Máxima longitud del sistema	Colocación del cable de elevación	
	1 ramal	2 ramales
60 m	0,2 t (1 ramal)	0,4 t (3 poleas)
71 m	0,3 t (1 polea)	0,4 t (3 poleas)
78 m	0,3 t (1 polea)	—

Observaciones sobre el trabajo con prolongación de pluma

- No está permitido realizar trabajos en la pluma principal si hay instalada una prolongación de pluma.
- Al trabajar con la prolongación de pluma y con el motón de gancho colocado en la pluma principal, las capacidades de carga se reducen como se muestra a continuación:

Peso de los accesorios del gancho/del motón de gancho	Prolongación de la pluma	
	26,0 m	32,0 m
8,0 t - 200 kg	200 kg	200 kg
20,0 t - 325 kg	300 kg	300 kg
50,0 t - 675 kg	600 kg	500 kg
75,0 t - 850 kg	700 kg	600 kg
100,0 t - 1150 kg	900 kg	800 kg

Indicación:

El limitador del momento de carga (LMB) no controla el peso del motón de gancho o el de una carga en la pluma principal. Este sólo registra la carga de la pluma de punta y el peso de la punta abatible o de la prolongación de la pluma.

- Si se trabaja con prolongación de pluma, las secciones telescopicas deben estar fijadas con pernos.
- Si es preciso bajar la pluma principal con la prolongación de pluma montada, antes se deben retraer todas las secciones telescopicas.

Atención:**Peligro de que haya un cable flojo.**

Según la longitud del sistema (longitud de la pluma principal + longitud de la pluma de punta) y de la colocación del cable de elevación se requiere un peso mínimo de motón de gancho con medio de sujeción. Si no se alcanza este peso mínimo y el motón de gancho se encuentra sin carga en la posición más elevada, puede aflojarse un cable en el tambor del mecanismo de elevación.

En la siguiente tabla figuran valores orientativos para el peso mínimo del motón de gancho:

Peso mínimo del motón de gancho en t (Motón de gancho)		
Máxima longitud del sistema	Colocación del cable de elevación	
	1	doble
60 m	0,2 t (de 1 ramal)	0,4 t (de 3 polea)
71 m	0,3 t (de 1 polea)	0,4 t (de 3 polea)
78 m	0,3 t (de 1 polea)	--

Combinaciones de contrapeso admisibles

Esta documentación describe sólo las combinaciones de contrapeso y las secuencias de equipamiento estándar previstas.

Para otras secuencias de equipamiento consulte el manual de instrucciones.

Esta documentación contiene en caso necesario combinaciones de contrapeso que no se pueden visualizar con las piezas sueltas suministradas o que no son parte del volumen de suministro.

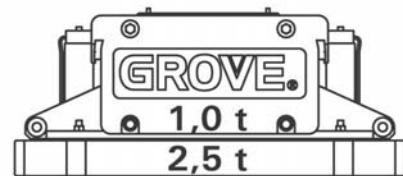

Según el estado de circulación deseado, son posibles otros elementos y combinaciones de contrapeso. Para indicaciones más detalladas consulte el manual de instrucciones.

Tablas de equipamiento de la pluma principal

Para poder bajar la pluma principal desde la zona de trabajo a un ángulo inferior a 15° aprox., las secciones telescopicas deben estar completamente retraídas o debe haberse ajustado el código LMB de equipamiento para la tabla correspondiente.

Según el estado de equipamiento (contrapeso, base de apoyo y radio de giro), se puede bajar la pluma principal estando extendida hasta 2,5 * sección telescopica (longitud de la pluma = 36,20 m) con los códigos LMB de equipamiento adecuados que se indican en las tablas de equipamiento siguientes.

Si existe una tabla de equipamiento para la pluma retraída, el LMB se conmuta automáticamente, es decir, no es necesario introducir el código LMB de equipamiento. Para todas las demás longitudes, sí es necesario introducirlo.

También puede utilizar las longitudes de extensión establecidas en las tablas de equipamiento para las tareas de mantenimiento realizadas dentro de la zona de la pluma principal.

Tablas de equipamiento de la punta rabatible

La pluma principal con la punta abatible montada puede extenderse hasta los alcances especificados en la siguiente tabla. Así mismo se indican en las siguientes tablas las cargas permitidas (peso del motón de gancho).

El limitador del momento de carga (LMB) controla la extensión y retracción de la pluma principal.

La bajada de la pluma principal con punta abatible montada sólo es posible cuando la pluma principal está retraída por completo (columna *1 con retracción 0 - 0 - 0).

El conjunto superior no debe ser girado al extender o retraer la pluma principal. Para ello tampoco se ha de utilizar la marcha rápida ni para el mecanismo elevador, ni para el mecanismo de cambio de alcance ni para la extensión o retracción.

5 secc. extendidas (60.00 m)		80°	1.2 t
4 secc. extendidas (50.71 m)		80°	1.5 t
2,5 secc. extendidas (36.45 m)		78°	1.5 t
0 secc. extendidas (12.90 m)		< 0°	2.0 t

Tablas de equipamiento de la prolongación de la pluma

La pluma principal debe presentar una inclinación determinada con respecto a la horizontal antes de que se pueda extender a la longitud deseada.

El LMB controla la extensión de la pluma principal.

Al extender la pluma principal no debe girarse el conjunto superior. Tampoco debe utilizarse la marcha rápida del mecanismo de elevación, del mecanismo para cambio de alcance ni de la extensión.

La inclinación conveniente de la pluma principal y la carga máxima de elevación (peso del motón de gancho) se especifican en las siguientes tablas.

Longitud de la prolongación de la pluma : **26 m**

Inclinación de la prolongación de la pluma a : **40°**

base de apoyo :	7.800 x 7.500 m			Nº de ident. :		3 174 180

Tablas de equipamiento de la punta rabatible

1 - 425

Tablas de equipamiento de la prolongación de la pluma

1 - 435

Capítulo 2 Pluma principal**N° de ident. 3 177 064**

Longitudes telescopicas de la pluma principal (sacar / entrar las secciones telescopicas)		2	-	1
3 174 436 Longitudes telescopicas (entrar)	7,80 x 7,50 m 360°	40.1 t	2	- 2
3 174 437 Longitudes telescopicas (sacar)	7,80 x 7,50 m 360°	40.1 t	2	- 8
3 174 540 Longitudes fijas	7,80 x 7,50 m 0° h.a.	40.1 t	2	- 16
3 174 550 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	40.1 t	2	- 17
3 174 541 Longitudes fijas	7,80 x 7,50 m 0° h.a.	28.5 t	2	- 18
3 174 551 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	28.5 t	2	- 19
3 174 542 Longitudes fijas	7,80 x 7,50 m 0° h.a.	26 t	2	- 20
3 174 552 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	26 t	2	- 21
3 174 543 Longitudes fijas	7,80 x 7,50 m 0° h.a.	23.5 t	2	- 22
3 174 553 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	23.5 t	2	- 23
3 174 544 Longitudes fijas	7,80 x 7,50 m 0° h.a.	21 t	2	- 24
3 174 554 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	21 t	2	- 25
3 174 545 Longitudes fijas	7,80 x 7,50 m 0° h.a.	18.5 t	2	- 26
3 174 555 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	18.5 t	2	- 27
3 174 546 Longitudes fijas	7,80 x 7,50 m 0° h.a.	16 t	2	- 28
3 174 556 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	16 t	2	- 29
3 174 547 Longitudes fijas	7,80 x 7,50 m 0° h.a.	13.5 t	2	- 30
3 174 557 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	13.5 t	2	- 31
3 174 548 Longitudes fijas	7,80 x 7,50 m 0° h.a.	11 t	2	- 32
3 174 558 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	11 t	2	- 33
3 174 549 Longitudes fijas	7,80 x 7,50 m 0° h.a.	8.5 t	2	- 34
3 174 559 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	8.5 t	2	- 35
3 174 560 Longitudes fijas	7,80 x 7,50 m 0° h.a.	6 t	2	- 36
3 174 563 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	6 t	2	- 37
3 174 561 Longitudes fijas	7,80 x 7,50 m 0° h.a.	3.5 t	2	- 38
3 174 564 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	3.5 t	2	- 39
3 174 562 Longitudes fijas	7,80 x 7,50 m 0° h.a.	1 t	2	- 40
3 174 565 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	1 t	2	- 41
3 174 410 Longitudes fijas	7,80 x 7,50 m 360°	40.1 t	2	- 43
3 174 420 Longitudes intermedias	7,80 x 7,50 m 360°	40.1 t	2	- 49
3 174 411 Longitudes fijas	7,80 x 7,50 m 360°	28.5 t	2	- 57
3 174 421 Longitudes intermedias	7,80 x 7,50 m 360°	28.5 t	2	- 63
3 174 412 Longitudes fijas	7,80 x 7,50 m 360°	26 t	2	- 69
3 174 422 Longitudes intermedias	7,80 x 7,50 m 360°	26 t	2	- 75
3 174 413 Longitudes fijas	7,80 x 7,50 m 360°	23.5 t	2	- 81
3 174 423 Longitudes intermedias	7,80 x 7,50 m 360°	23.5 t	2	- 87
3 174 414 Longitudes fijas	7,80 x 7,50 m 360°	21 t	2	- 93
3 174 424 Longitudes intermedias	7,80 x 7,50 m 360°	21 t	2	- 99
3 174 415 Longitudes fijas	7,80 x 7,50 m 360°	18.5 t	2	- 105
3 174 425 Longitudes intermedias	7,80 x 7,50 m 360°	18.5 t	2	- 111

3 174 416	Longitudes fijas	7,80 x 7,50 m	360°	16 t 2	-	117
3 174 426	Longitudes intermedias	7,80 x 7,50 m	360°	16 t 2	-	123
3 174 417	Longitudes fijas	7,80 x 7,50 m	360°	13.5 t 2	-	129
3 174 427	Longitudes intermedias	7,80 x 7,50 m	360°	13.5 t 2	-	135
3 174 418	Longitudes fijas	7,80 x 7,50 m	360°	11 t 2	-	141
3 174 428	Longitudes intermedias	7,80 x 7,50 m	360°	11 t 2	-	147
3 174 419	Longitudes fijas	7,80 x 7,50 m	360°	8.5 t 2	-	153
3 174 429	Longitudes intermedias	7,80 x 7,50 m	360°	8.5 t 2	-	159
3 174 430	Longitudes fijas	7,80 x 7,50 m	360°	6 t 2	-	165
3 174 433	Longitudes intermedias	7,80 x 7,50 m	360°	6 t 2	-	171
3 174 431	Longitudes fijas	7,80 x 7,50 m	360°	3.5 t 2	-	177
3 174 434	Longitudes intermedias	7,80 x 7,50 m	360°	3.5 t 2	-	183
3 174 432	Longitudes fijas	7,80 x 7,50 m	360°	1 t 2	-	189
3 174 435	Longitudes intermedias	7,80 x 7,50 m	360°	1 t 2	-	195
3 174 440	Longitudes fijas	7,80 x 6,70 m	360°	40.1 t 2	-	203
3 174 450	Longitudes intermedias	7,80 x 6,70 m	360°	40.1 t 2	-	209
3 174 441	Longitudes fijas	7,80 x 6,70 m	360°	28.5 t 2	-	217

Cargas extensibles/retraíbles

En este apartado se proporciona las cargas máximas con las con la que se puede extender/retraer la pluma.

- El LMB no controla estas cargas. Aún así, están situadas dentro del margen de cargas controlado por el LMB para longitudes intermedias (véase el siguiente apartado del capítulo "Pluma Principal").
- La carga con la que se puede extender/retraer la pluma está limitada por:
 - El ángulo de inclinación de la pluma.
 - El estado de lubricación de las piezas deslizantes entre las secciones telescopicas.
 - La base de apoyo actual.
 - El contrapeso actual.
 - El número de ramales de cable de elevación colocados.
- La extracción/retracción de las cargas debe realizarse únicamente con gran base de apoyo y contrapeso máximo (aunque no formen parte del volumen de suministro) . Con contrapesos y bases de apoyo reducidos es aconsejable, en caso necesario, realizar reducciones para asegurar la estabilidad. Para determinar que en el estado de equipamiento seleccionado es posible extender/retraer la pluma se deben tener en cuenta también las cargas correspondientes a las longitudes intermedias (véase el siguiente apartado del capítulo "Pluma principal").

Operación de la grúa sin apoyas

- Los telescopios se deben extender de acuerdo con los estados telescopiados.
- Suspensión bloqueada.
- Para los trabajos en exteriores es necesario extender los soportes de apoyo según el espacio disponible. Los cilindros de apoyo por su parte deben extenderse de manera que queden pegando casi con el suelo.
- El freno del mecanismo de giro está puesto.
- Presión mínima de los neumáticos: 10,0 bar con neumáticos 14.00 R25
9,0 bar con neumáticos 16.00 R25
7,0 bar con neumáticos 20.50 R25

El desplazamiento de la grúa con carga está permitido sólo bajo las condiciones siguientes:

- Carga fijada
- Velocidad de marcha: velocidad al paso (0,4 m/seg o 1,5 km/h).

Operación de la grúa sin apoyas

- Los telescopios se deben extender de acuerdo con los estados telescopiados.
- Suspensión bloqueada.
- Para los trabajos en exteriores es necesario extender los soportes de apoyo según el espacio disponible. Los cilindros de apoyo por su parte deben extenderse de manera que queden pegando casi con el suelo.
- El freno del mecanismo de giro está puesto.
- Presión mínima de los neumáticos: 10,0 bar con neumáticos 14.00 R25
9,0 bar con neumáticos 16.00 R25
7,0 bar con neumáticos 20.50 R25

El desplazamiento de la grúa con carga está permitido sólo bajo las condiciones siguientes:

- Carga fijada
- Velocidad de marcha: velocidad al paso (0,4 m/seg o 1,5 km/h).

Operación de la grúa sin apoyas

- Los telescopios se deben extender de acuerdo con los estados telescopiado.
- Suspensión bloqueada.
- Para los trabajos en exteriores es necesario extender los soportes de apoyo según el espacio disponible. Los cilindros de apoyo por su parte deben extenderse de manera que queden pegando casi con el suelo.
- El freno del mecanismo de giro está puesto.
- Presión mínima de los neumáticos: 10,0 bar con neumáticos 14.00 R25
9,0 bar con neumáticos 16.00 R25
7,0 bar con neumáticos 20.50 R25

El desplazamiento de la grúa con carga está permitido sólo bajo las condiciones siguientes:

- Carga fijada
- Velocidad de marcha: velocidad al paso (0,4 m/seg o 1,5 km/h).

Operación de la grúa sin apoyas

- Los telescopios se deben extender de acuerdo con los estados telescopiado.
- Suspensión bloqueada.
- Para los trabajos en exteriores es necesario extender los soportes de apoyo según el espacio disponible. Los cilindros de apoyo por su parte deben extenderse de manera que queden pegando casi con el suelo.
- El freno del mecanismo de giro está puesto.
- Presión mínima de los neumáticos: 10,0 bar con neumáticos 14.00 R25
9,0 bar con neumáticos 16.00 R25
7,0 bar con neumáticos 20.50 R25

El desplazamiento de la grúa con carga está permitido sólo bajo las condiciones siguientes:

- Carga fijada
- Velocidad de marcha: velocidad al paso (0,4 m/seg o 1,5 km/h).

Tablas de equipamiento de la punta rabatible

1 - 425

Tablas de equipamiento de la prolongación de la pluma

1 - 435

Capítulo 2 Pluma principal**N° de ident. 3 177 064**

Longitudes telescopicas de la pluma principal (sacar / entrar las secciones telescopicas)		2	-	1
3 174 436 Longitudes telescopicas (entrar)	7,80 x 7,50 m 360°	40.1 t	2	- 2
3 174 437 Longitudes telescopicas (sacar)	7,80 x 7,50 m 360°	40.1 t	2	- 8
3 174 540 Longitudes fijas	7,80 x 7,50 m 0° h.a.	40.1 t	2	- 16
3 174 550 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	40.1 t	2	- 17
3 174 541 Longitudes fijas	7,80 x 7,50 m 0° h.a.	28.5 t	2	- 18
3 174 551 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	28.5 t	2	- 19
3 174 542 Longitudes fijas	7,80 x 7,50 m 0° h.a.	26 t	2	- 20
3 174 552 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	26 t	2	- 21
3 174 543 Longitudes fijas	7,80 x 7,50 m 0° h.a.	23.5 t	2	- 22
3 174 553 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	23.5 t	2	- 23
3 174 544 Longitudes fijas	7,80 x 7,50 m 0° h.a.	21 t	2	- 24
3 174 554 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	21 t	2	- 25
3 174 545 Longitudes fijas	7,80 x 7,50 m 0° h.a.	18.5 t	2	- 26
3 174 555 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	18.5 t	2	- 27
3 174 546 Longitudes fijas	7,80 x 7,50 m 0° h.a.	16 t	2	- 28
3 174 556 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	16 t	2	- 29
3 174 547 Longitudes fijas	7,80 x 7,50 m 0° h.a.	13.5 t	2	- 30
3 174 557 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	13.5 t	2	- 31
3 174 548 Longitudes fijas	7,80 x 7,50 m 0° h.a.	11 t	2	- 32
3 174 558 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	11 t	2	- 33
3 174 549 Longitudes fijas	7,80 x 7,50 m 0° h.a.	8.5 t	2	- 34
3 174 559 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	8.5 t	2	- 35
3 174 560 Longitudes fijas	7,80 x 7,50 m 0° h.a.	6 t	2	- 36
3 174 563 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	6 t	2	- 37
3 174 561 Longitudes fijas	7,80 x 7,50 m 0° h.a.	3.5 t	2	- 38
3 174 564 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	3.5 t	2	- 39
3 174 562 Longitudes fijas	7,80 x 7,50 m 0° h.a.	1 t	2	- 40
3 174 565 Longitudes intermedias	7,80 x 7,50 m 0° h.a.	1 t	2	- 41
3 174 410 Longitudes fijas	7,80 x 7,50 m 360°	40.1 t	2	- 43
3 174 420 Longitudes intermedias	7,80 x 7,50 m 360°	40.1 t	2	- 49
3 174 411 Longitudes fijas	7,80 x 7,50 m 360°	28.5 t	2	- 57
3 174 421 Longitudes intermedias	7,80 x 7,50 m 360°	28.5 t	2	- 63
3 174 412 Longitudes fijas	7,80 x 7,50 m 360°	26 t	2	- 69
3 174 422 Longitudes intermedias	7,80 x 7,50 m 360°	26 t	2	- 75
3 174 413 Longitudes fijas	7,80 x 7,50 m 360°	23.5 t	2	- 81
3 174 423 Longitudes intermedias	7,80 x 7,50 m 360°	23.5 t	2	- 87
3 174 414 Longitudes fijas	7,80 x 7,50 m 360°	21 t	2	- 93
3 174 424 Longitudes intermedias	7,80 x 7,50 m 360°	21 t	2	- 99
3 174 415 Longitudes fijas	7,80 x 7,50 m 360°	18.5 t	2	- 105
3 174 425 Longitudes intermedias	7,80 x 7,50 m 360°	18.5 t	2	- 111

3 174 416	Longitudes fijas	7,80 x 7,50 m	360°	16 t 2	-	117
3 174 426	Longitudes intermedias	7,80 x 7,50 m	360°	16 t 2	-	123
3 174 417	Longitudes fijas	7,80 x 7,50 m	360°	13.5 t 2	-	129
3 174 427	Longitudes intermedias	7,80 x 7,50 m	360°	13.5 t 2	-	135
3 174 418	Longitudes fijas	7,80 x 7,50 m	360°	11 t 2	-	141
3 174 428	Longitudes intermedias	7,80 x 7,50 m	360°	11 t 2	-	147
3 174 419	Longitudes fijas	7,80 x 7,50 m	360°	8.5 t 2	-	153

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.

- Los valores de basculación mencionados arriba son controlados por el limitador del momento de carga (LMB) tan sólo de forma indirecta a pesar de que éstos se hallan entre los valores de cargas correspondientes al ángulo intermedio que controla el limitador del momento de carga (LMB).
- La carga basculante viene limitada por el ángulo de inclinación de la pluma y de la punta, así como por la presión dinámica de servicio del cilindro basculante de la punta. En caso de superarse la presión dinámica de servicio, el limitador del momento de carga (LMB) interrumpe la bajada.
